Final Report - Spring 2014 Rare Plant Monitoring at Lake Atalanta Park, Rogers, Arkansas

By Theo Witsell, Arkansas Natural Heritage Commission

Executive Summary

In January, April, and May of 2014, staff of the Arkansas Natural Heritage Commission (ANHC) and the City of Rogers conducted rare plant species monitoring in Lake Atalanta Park. Locations of all rare plants previously documented from the park were marked on the ground. Additional populations of two rare species previously known from the park and populations of two rare species not previously known from the park were found. Maps and detailed information are provided for all known occurrences of these spring-blooming rare plants in the park. An updated annotated list of plant species documented from the park is also provided.

Background and Results

Lake Atalanta Park is owned by the City of Rogers and includes properties surrounding Lake Atalanta. In December of 2013 the City of Rogers contracted with the ANHC to conduct rare plant monitoring on city-owned lands surrounding Lake Atalanta during the winter and spring of 2014. This monitoring work included marking the locations (on the ground) of all known rare plant species and conducting surveys of certain areas for additional rare plant species that are identifiable in the winter and spring. The following site visits were made to Lake Atalanta Park in 2014:

30 January 2014 – Theo Witsell (ANHC Botanist), David Hook (City of Rogers), and Ellen Turner (Northwest Arkansas Community College)

31 January 2014 – Theo Witsell (ANHC Botanist) and David Hook (City of Rogers)

16 April 2014 – Theo Witsell (ANHC Botanist) and David Hook (City of Rogers)

17 April 2014 – Theo Witsell (ANHC Botanist) and David Hook (City of Rogers)

18 April 2014 – Theo Witsell (ANHC Botanist)

25 April 2014 – Theo Witsell (ANHC Botanist) and David Hook (City of Rogers)

30 May 2014 – Theo Witsell (ANHC Botanist)

Activities performed on these trips included marking the locations of known rare plant populations, conducting surveys for rare plant species best located and identified in spring, and conducting additional

inventory of specific habitats or areas of conservation interest within the park. Additional populations of Ozark Trillium and Taper-tip Wild Ginger, two rare plant species known from the park, were discovered, and populations of Prairie White Trout Lily and Cluster Sedge, two rare plant species not previously known from the park, were also found.

Appendix B of this report provides updated information on occurrences of the spring-blooming rare plants in Lake Atlanta Park: Taper-tip Wild Ginger (*Asarum canadense* var. *acuminatum*), Cluster Sedge (*Carex aggregata*), Prairie White Trout Lily (*Erythronium mesochoreum*), and Ozark Trillium (*Trillium ozarkanum*). This report does not include information on the summer- and fall-blooming rare plants: Church's Wild Rye (*Elymus churchii*), Pale Gentian (*Gentiana alba*), White Rattlesnake-root (*Prenanthes alba*), Smooth Rosinweed (*Silphium integrifolium* var. *laeve*), and Slender Nettle (*Urtica gracilis*). Information on occurrences of these species is provided in the 2013 ANHC report. Both reports will need to be consulted for a full accounting of the known rare plants in the park.

An updated master list of plant species occurring in Lake Atalanta Park is provided in Appendix D. Sixty-nine species were added to the existing (2013) list based on inventory work conducted in spring of 2014. This brings the total number of plant species documented from the park to 608.

Acknowledgments

David Hook (City of Rogers) accompanied me during most of the site visits in Lake Atalanta Park, and Ellen Turner accompanied us both on one trip.

APPENDIX B:

**SPRING-BLOOMING SPECIES OF CONSERVATION CONCERN
FOUND AT LAKE ATALANTA PARK**

The following species occurring at Lake Atalanta Park have been identified by the Arkansas Natural Heritage Commission as being of conservation concern in Arkansas. Those preceded by an asterisk () are best identified in spring and are included in this report. Each of these spring species is presented with general information on its range and habitat followed by specific information on populations found at Lake Atalanta Park. Each species is also given along with its global (G) and state (S) conservation status ranks. A legend explaining these rank codes is provided in appendix C.*

- 1) * Taper-tip Wild Ginger (*Asarum canadense* var. *acuminatum*) – G5TNRS1
- 2) * Cluster Sedge (*Carex aggregata*) – G5S1
- 3) Pale Gentian (*Gentiana alba*) – G4S1
- 4) Church's Wild Rye (*Elymus churchii*) – G2G3S2?
- 5) * Prairie White Trout Lily (*Erythronium mesochoreum*) – G4G5S1S2
- 6) White Rattlesnake-root (*Prenanthes alba*) – G5S1S2
- 7) Smooth Rosinweed (*Silphium integrifolium* var. *laeve*) – G5T4?S1
- 8) * Ozark Trillium (*Trillium ozarkanum*) – G3S3
- 9) Slender Nettle (*Urtica gracilis*) – G5S1

Taper-tip Wild Ginger (*Asarum canadense* var. *acuminatum*) – G5TNRS1

This variety of wild ginger is characterized by its large size, acuminate leaf tips, and flowers with long, tapering tips that are not reflexed. Its distribution is primarily northern and Appalachian. It is rare in Arkansas, where it is known only from mesic calcareous forests in Benton and Stone counties. It was first documented in Arkansas from Lake Atalanta Park on 15 May 2011 from at two sites (sites 1 and 2 below), both associated with mesic hardwood forests along small streams. Two additional sites (sites 3 and 4 below) were found in April 2014.

It should be noted that another variety of wild ginger, *Asarum canadense* var. *reflexum*, also occurs at Lake Atalanta Park. This variety is common in Arkansas and can be identified by its smaller size, bluntly rounded leaf tips, and flowers with short, abruptly reflexed tips. At sites where the two varieties occur together, var. *acuminatum* is generally restricted to moist, high pH sites, while var. *reflexum* can occur in habitats with a broader range of conditions. While most patches of wild ginger seen at Lake Atalanta Park in 2014 were clearly var. *reflexum*, a few patches were observed in mesic habitat that lacked mature flowering plants and could not be confidently determined to variety.

SITE 1: Centrum = 36.33608, -94.10279

50+ plants were observed on 25 April 2014 scattered in a mesic ravine on the west side of Lake Atalanta.

SITE 2: Centrum = 36.32919, -94.10961

75+ plants were observed on 25 April 2014 in a mesic ravine upstream of Lake Atalanta near the junction of two streams near a trail crossing. This population was marked with flagging tape to avoid damage during nearby trail construction.

SITE 3: Centrum = 36.33054, -94.10675

Three plants were observed on 16 April 2014 on the west side-slope of “Frisco Spring Hollow” upstream from Walnut Street. This site is in the vicinity of an obvious but unofficial trail leading from the official trail on the valley floor to a small bluffline upslope. One plant was observed immediately south of this trail (at 36.33047, -94.10679), and two plants were observed about 35 feet north of this trail (at 36.33054, -94.10675), associated with a small wet-weather seepage area. Habitat is degraded mesic hardwood forest with limestone derived soils. Associate species include early wild rye (*Elymus macgregorii*), spreading chervil (*Chaerophyllum procumbens*), burning-bush (*Euonymus alatus*), winter-creeper (*Euonymus fortunei*), spicebush (*Lindera benzoin*), purple dead-nettle (*Lamium purpureum*), cleavers (*Galium aparine*), woodland blue grass (*Poa sylvestris*), Japanese honeysuckle (*Lonicera japonica*), rock buttercup (*Ranunculus micranthus*), American elm (*Ulmus americana*), and box elder (*Acer negundo*). These plants were marked with pinflags to avoid damage during nearby trail construction.

SITE 4: Centrum = 36.32817, -94.10137

Several plants were observed on the uphill side of a recently installed trail. Habitat was a degraded mesic forest on a lower east-facing slope with limestone-derived soils. Canopy species include white oak (*Quercus alba*), black walnut (*Juglans nigra*), and sugar maple (*Acer saccharum*). Associate species include Japanese honeysuckle (*Lonicera japonica*), rue-anemone (*Thalictrum thalictroides*), Canadian black-snakeroot (*Sanicula canadensis*), multiflora rose (*Rosa multiflora*), nodding fescue (*Festuca subverticillata*), and Chinese privet (*Ligustrum sinense*).

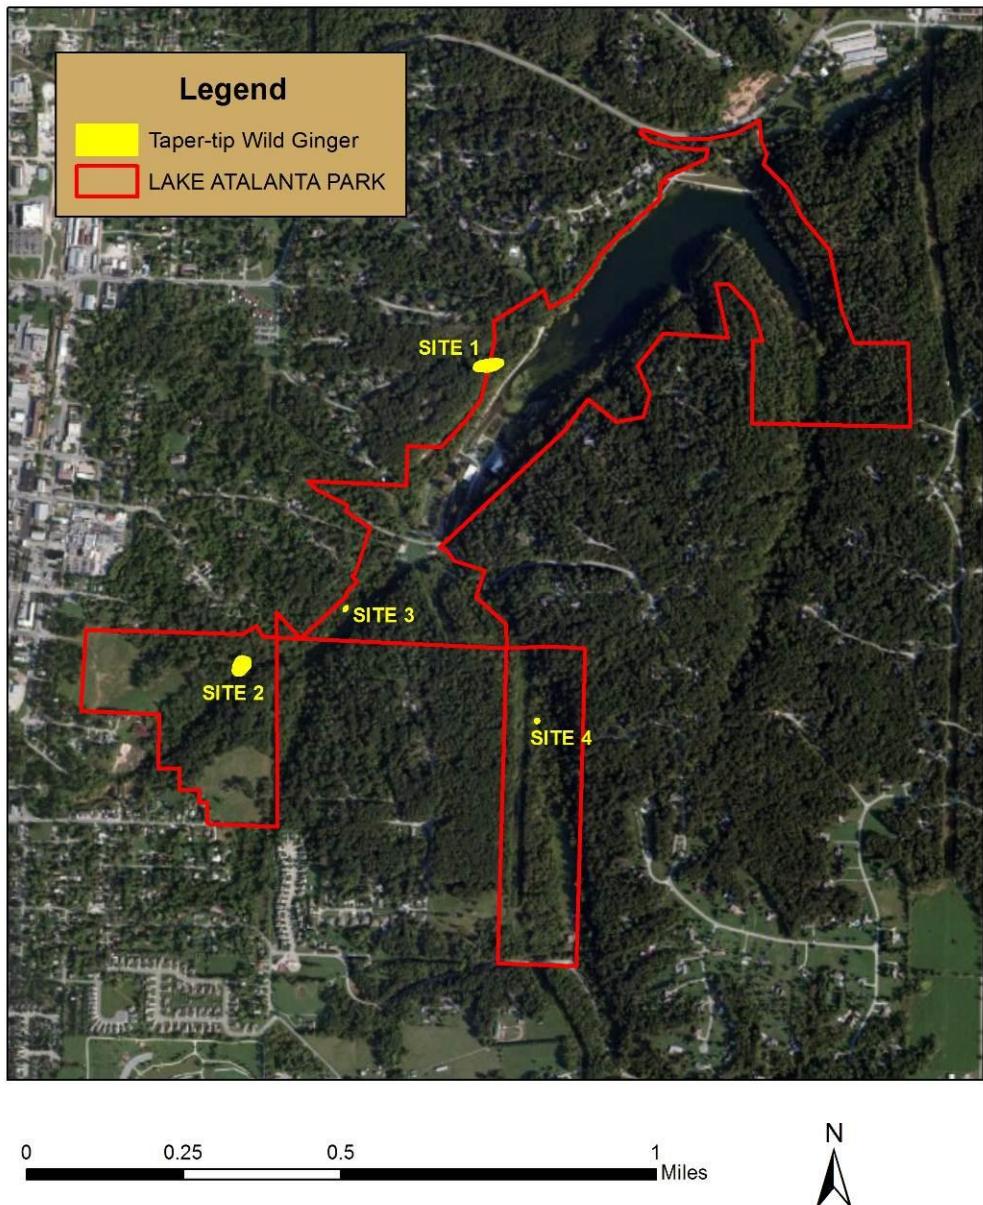

FIGURE 4. Map showing location of Taper-tip Wild Ginger at Lake Atalanta Park. Map by Theo Witsell, ANHC, 2014.

Cluster Sedge (*Carex aggregata*) – G5S1

This northern species is at the southern edge of its range in the Ozarks. It is known in Arkansas only from a few sites in Benton, Washington, Fulton, and Sharp counties. It was found in two areas of Lake Atalanta Park on 30 May 2014.

SITE 1: Centrum = 36.33387, -94.10383

A single clump was observed in a wet open area along a small spring run on the southwest side of Lake Atalanta. Associate species include eastern narrowleaf sedge (*Carex amphibola*), yellowfruit sedge (*Carex annectens*), Frank's sedge (*Carex frankii*), limestone meadow sedge (*Carex granularis*), fox sedge (*Carex vulpinoidea*), and early wild rye (*Elymus macgregorii*).

SITE 2: Centrum = 36.33248, -94.10543

Several clumps were observed at the south edge of an open mowed area, just above a steep ravine that drops down to a stream that runs parallel to Walnut Street. Associate species include nodding fescue (*Festuca subverticillata*), early wild rye (*Elymus macgregorii*), ground-ivy (*Glechoma hederacea*), cinnamon-vine (*Dioscorea polystachya*), Japanese stilt grass (*Microstegium vimineum*), eastern narrowleaf sedge (*Carex amphibola*), and eastern woodland sedge (*Carex blanda*).

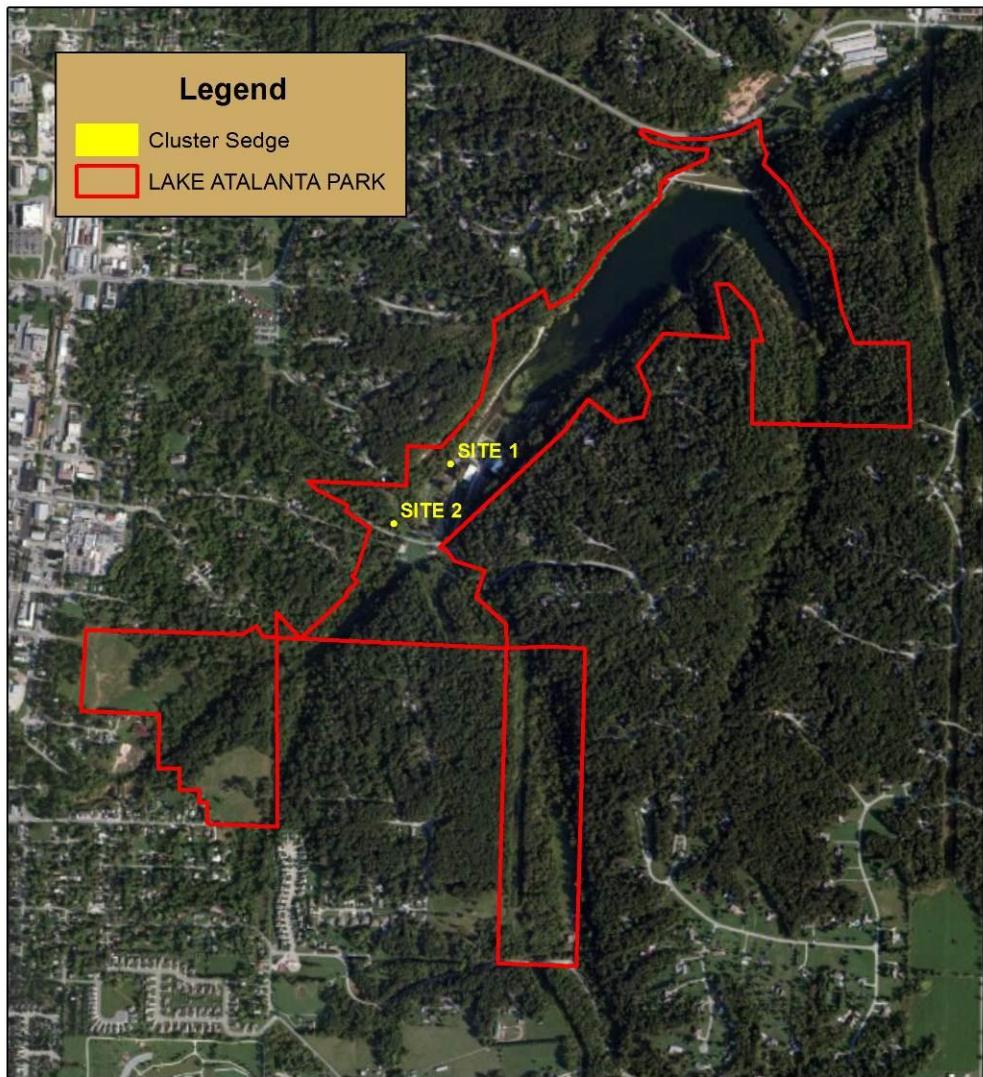

FIGURE 5. Map showing location of Cluster Sedge at Lake Atalanta Park. Map by Theo Witsell, ANHC, 2014.

Prairie White Trout Lily (*Erythronium mesochoreum*) – G4G5S1S2

This Midwestern prairie species is a rare species of glades, barrens, and upland prairies in Arkansas. It is distinguished from the common white trout lily (*Erythronium albidum*) by its folded leaves, its tendency to occur singly (rather than form dense colonies), its fruit that lay on the ground, and its preference for dry open habitat.

Site #1: Centrum = 36.34030, -94.09478

This species was observed on 17 April 2014 scattered in a limestone glade and adjacent rocky woodland at the downhill edge of a powerline right-of-way east of the Lake Atalanta dam. Associate species include wiry witch grass (*Panicum flexile*), side-oats grama (*Bouteloua curtipendula*), little bluestem (*Schizachyrium scoparium*), widow's-cross (*Sedum pulchellum*), purple-stem cliff-brake (*Pellaea atropurpurea*), three-flower melic grass (*Melica nitens*), and eastern red-cedar (*Juniperus virginiana*), growing under chinquapin oak (*Quercus muehlenbergii*), white ash (*Fraxinus americana*), winged elm (*Ulmus alata*), dwarf hackberry (*Celtis tenuifolia*), and eastern redbud (*Cercis canadensis*).

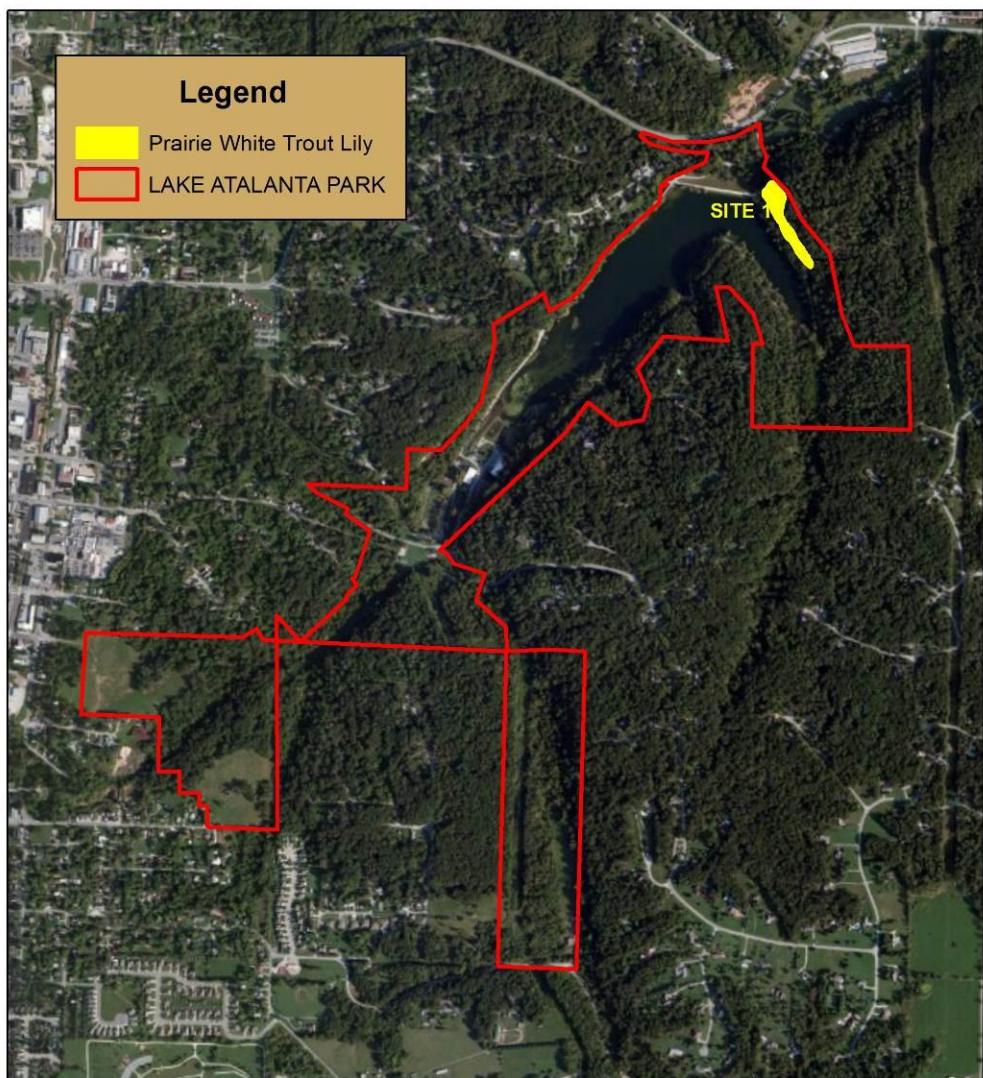

FIGURE 6. Map showing location of Prairie White Trout Lily at Lake Atalanta Park. Map by Theo Witsell, ANHC, 2014.

Ozark Trillium (*Trillium ozarkanum*) – G3S3

Ozark trillium is found only in the Ozark Plateau and Ouachita Mountains of Arkansas, Missouri, and Oklahoma and is a species of conservation concern in all of these states. It is typically found in acidic woodlands on chert substrates and is one of the first woodland wildflowers to bloom in spring, beginning to flower in early March in some years. In addition to the population reported in the 2013 ANHC report (Site 1 below), two additional populations were discovered in the park in 2014.

SITE 1: Centrum = 36.32871, -94.10900

More than 1,000 plants were observed on 16 April 2014 with more than 200 in flower. Habitat is an open, northwest-facing dry-mesic forest on chert substrate, dominated by white oak (*Quercus alba*) and black oak (*Quercus velutina*). Associate species include Oriental bittersweet (*Celastrus orbiculatus*), mayapple (*Podophyllum peltatum*), spicebush (*Lindera benzoin*), Virginia-creeper (*Parthenocissus quinquefolia*), and sassafras (*Sassafras albidum*). This population was previously known to exist, but the size and extent were not previously documented. The extent of this population was mapped with a GPS unit and is provided below.

SITE 2: Centrum = 36.32678, -94.10115

30 - 40 sterile (non-flowering) plants were observed on 18 April 2014 on the uphill side of a recently installed trail. This area had been recently burned, and plants were only identifiable in a small area above the trail that did not burn. It is likely that there are more Ozark Trillium plants in this area. Habitat is an east-facing dry-mesic forest on chert substrate, dominated by white oak (*Quercus alba*) and black oak (*Quercus velutina*). Associate species include burning-bush (*Euonymus alatus*), box elder (*Acer negundo*), woolly blue violet (*Viola sororia*), carrion-flower (*Smilax pulverulenta*), May-apple (*Podophyllum peltatum*), multiflora rose (*Rosa multiflora*), rock buttercup (*Ranunculus micranthus*), bloodroot (*Sanguinaria canadensis*), and rue-anemone (*Thalictrum thalictroides*).

SITE 3: Centrum = 36.32476, -94.10116

75+ sterile (non-flowering) plants and a single flowering plant were observed on 18 April 2014 on both sides of a recently installed trail in an area of switchbacks. Habitat is an east-facing dry-mesic forest on chert substrate, dominated by white oak (*Quercus alba*) and black oak (*Quercus velutina*). Associate species include Japanese honeysuckle (*Lonicera japonica*), spicebush (*Lindera benzoin*), coral-berry (*Symplocarpus orbiculatus*), rusty blackhaw (*Viburnum rufidulum*), burning-bush (*Euonymus alatus*), flowering dogwood (*Cornus florida*), and multiflora rose (*Rosa multiflora*).

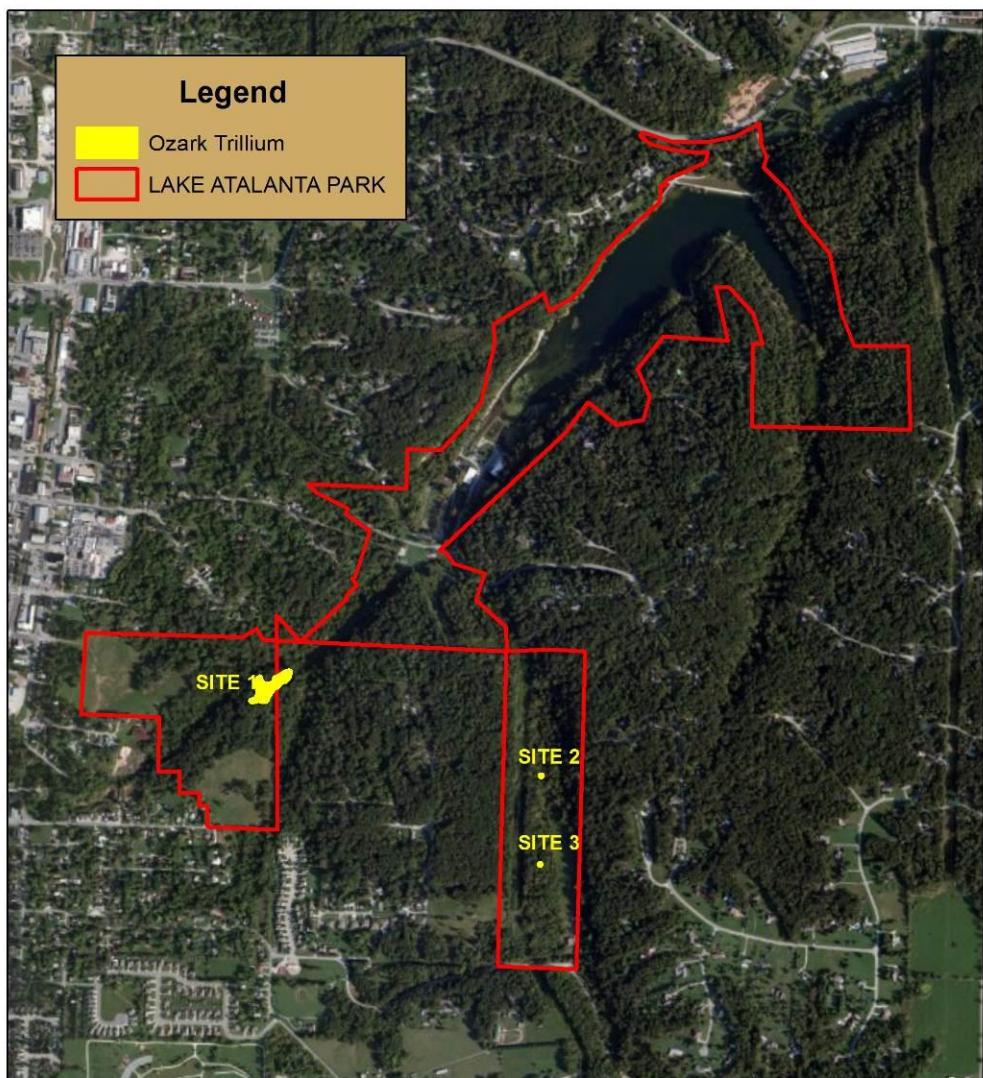

FIGURE 7. Map showing location of Ozark Trillium at Lake Atalanta Park. Map by Theo Witsell, ANHC, 2014.

APPENDIX C: CONSERVATION STATUS CODE/RANK LEGEND

DEFINITION OF RANKS

GLOBAL RANKS

G1	=	Critically Imperiled Globally. At a very high risk of extinction due to extreme rarity (often 5 or fewer populations), very steep declines, or other factors.
G2	=	Imperiled Globally. At high risk of extinction due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors.
G3	=	Vulnerable Globally. At moderate risk of extinction due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors.
G4	=	Apparently Secure Globally. Uncommon but not rare; some cause for long-term concern due to declines or other factors.
G5	=	Secure Globally. Common, widespread and abundant.
GH	=	Of Historical Occurrence, Possibly Extinct Globally. Missing; known from only historical occurrences, but still some hope of rediscovery.
GU	=	Unrankable. Currently unrankable due to lack of information or due to substantially conflicting information about status or trends.
GX	=	Presumed Extinct Globally. Not located despite intensive searches and virtually no likelihood of rediscovery.
GNR	=	Unranked. The global rank not yet assessed.
GNA	=	Not Applicable. A conservation status rank is not applicable.
T-Ranks	=	T subranks are given to global ranks when a subspecies, variety, or race is considered at the state level. The subrank consists of a "T" plus a number or letter (1, 2, 3, 4, 5, H, U, X) with the same ranking rules as a full species.

STATE RANKS

S1	=	Critically Imperiled in the State. At a very high risk of extirpation due to extreme rarity (often 5 or fewer populations), very steep declines, or other factors.
S2	=	Imperiled in the State. At high risk of extirpation due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors.
S3	=	Vulnerable in the State. At moderate risk of extirpation due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors.
S4	=	Apparently Secure in the State. Uncommon but not rare; some cause for long-term concern due to declines or other factors.
S5	=	Secure in the State. Common, widespread and abundant.
SH	=	Of Historical Occurrence, with Some Possibility of Rediscovery. Its presence may not have been verified in the past 20 - 40 years. A species may be assigned this rank without the 20 - 40 year delay if the only known occurrences were destroyed or if it had been extensively and unsuccessfully sought.
SU	=	Unrankable. Currently unrankable due to lack of information or due to substantially conflicting information about status or trends.

SX	=	Presumed Extirpated from the State. Not located despite intensive searches and virtually no likelihood of rediscovery.
SNR	=	Unranked. The state rank not yet assessed.
SNA	=	Not Applicable. A conservation status rank is not applicable.

GENERAL RANKING NOTES

Q	=	A “Q” in the global rank indicates the element’s taxonomic classification as a species is a matter of conjecture among scientists.
Ranges	=	Ranges are used to indicate a range of uncertainty about the status of the element.
?	=	A question mark is used to denote an inexact numeric rank.

**APPENDIX D: UPDATED LIST OF PLANT SPECIES FOUND AT
LAKE ATALANTA PARK**

Annotated Checklist of Vascular Plant Taxa Documented at
Lake Atalanta Park

Nomenclature according to Gentry et al., eds. 2013. *Atlas of the Vascular Plants of Arkansas*.

Scientific Name*	Common Name	Growth Form	Habitat(s)	Source	Voucher	Herbarium

Scientific Name*	Common Name	Growth Form	Habitat(s)	Source	Voucher	Herbarium
------------------	-------------	-------------	------------	--------	---------	-----------

Total Taxa: 608

Growth Form:	Growth Form Description:
Forb	herbaceous flowering annual or perennial, non-graminoid plant
Graminoid	herbaceous annual or perennial grass or grass-like plant (here defined including only true grasses, sedges, and rushes)
Fern or Fern Ally	vascular, non-flowering plant that reproduces by spores
Herbaceous Vine	herbaceous annual or perennial twining/climbing plant with relatively long stems
Woody Vine	perennial, woody or semi-woody twining/climbing plant with relatively long stems [may not appear especially 'woody' but does not die back to ground in winter...e.g., some members of greenbrier family]
Shrub	perennial, often multi-stemmed woody or semi-woody plant usually less than 5 meters (16 feet) in height at maturity [including bamboo members of the grass family]
Tree	perennial, often single-stemmed woody plant typically greater than 5 meters (16 feet) in height at maturity [seedlings, saplings, and stunted individuals of such taxa are also included in this category]

Habitats:

A = limestone glade and woodland

B = chert woodland

C = mesic hardwood forest

D = riparian forest

E = spring run

F = lakeshore

G = field

H = disturbed area
